# BROACHING.

**Made in Switzerland**  
since 1969

## PCM WILLEN SA

For over 40 years, PCM Willen SA is one of the world's leading manufacturers of special tool holders for automatic lathes.

All our products are developed and manufactured in Switzerland and bear the label «Swiss Made», which is synonymous with precision, quality and reliability.

Our company is located in the middle of French-speaking part of Switzerland at the edge of Lake Geneva near Montreux.

Our international dealer network ensures continued after sales support. We offer training courses, which we tailor to individual customer requirements.

PCM stays for innovation and progress. Our superbly qualified engineering staff ensures finest quality of manufacturing solutions and keeps our customers ahead of the competition.

In close cooperation with machine builders and end users, we stay on the way to satisfied customers. We will keep this track in the future.

The best quality toolholders can only provide optimum performance if they are maintained or repaired with first class replacement parts. PCM experts emphasize professional after sale support for all PCM equipment.

## BROACHING

Since broaching operation can be performed on a part that is rotating, turned parts requiring a broached hole can be completed in the original setup on a screw machine or CNC turning machine.

This eliminates the need for secondary operation. The rotary broaching can also be applied on CNC machining centre or transfer machine.

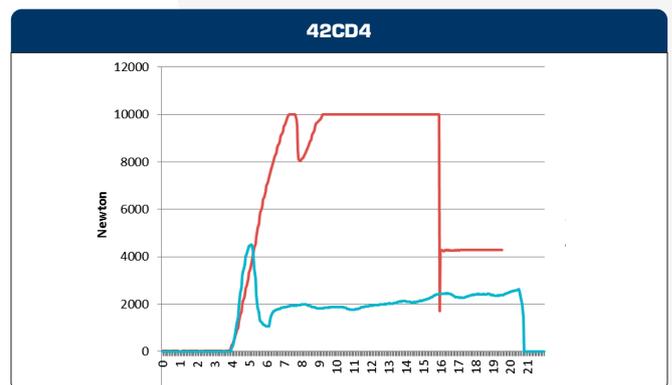

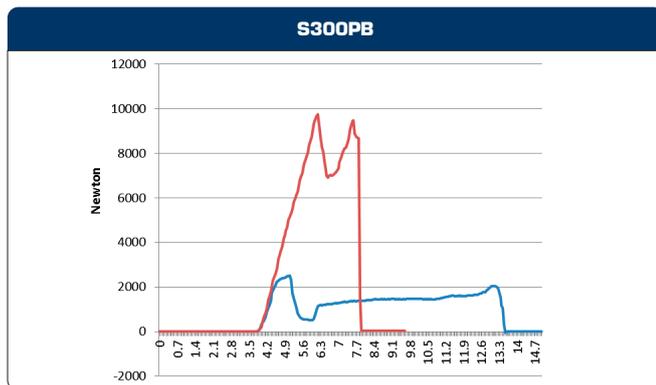

The only difference being that the broach holder is rotated in the machine spindle and the part is stationary instead of the reverse condition on a turning machine.

In order to produce parts successfully there are some basic rules that must be followed. Broaching rotation speed

The centreline of the cutting tool is offset at 1° from the centreline of the work piece.

This causes the broach to shear its way into the part with a scalloping effect as it is advanced into the work piece and makes it to cut only on its leading edge, not its full end surface.

This eases the load of the cut and creates a shearing, rotational cutting action reducing the thrust force up to 80%.

## E

## MANUAL

### Centering the broach

Nothing is more important than having the cutter centered as close as possible to the center of the workpiece. Improper center setting will cause uneven hole configurations, oversize holes and spiralling. For an easy setting use our gages 6189-280 or 6199-550.

### Drilling the hole

In general, we recommend drilling the hole 1% larger than the largest of the areas measured mass. Wherein material having a lower strength, the bore can be reduced. The drilling depth for blind hole 6-point must be 1.3 to 1.4 times to have the depth of the profile.

### Broach pre-guidance

A chamfer, slightly bigger than the largest dimensions of the broach, is essential for easy starting of the broach. When exact concentricity is required, drill a pre-bore equivalent to the broach dimensions across corners. This keeps the broach concentric when broaching operation starts.

### Broaching rotation speed

Rotational speed has almost no effect on cutting speed and tool life. However, at high speed, cutting edges of the broach tend to mill the material when starting causing tool wear. Therefore, start broaching operation at a slow rotation of 300 RPM and a feed of 0.1 mm/RPM until the broach is touching the material, then increase speed up to 2000 RPM and the feed to the result of your calculation (see next paragraph).

Spiralling can be reduced by reversing the spindle rotation half way into the part. For a faster worktime increase the speed but never the feed!

### Feed rate

The feed choice mainly depends on material characteristics. To found the feed that will be used, you can make this calculation:  $0.002 \times (\text{outer dimension of broach})$

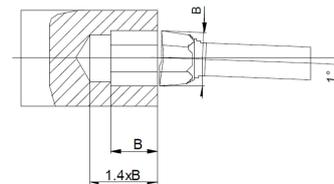

**Expl.:** Broach of 6mm hex  
 $0.002 \times 6\text{mm} = 0.012 \text{ mm/rpm}$

### Coolant

Usual coolant or cutting oil

### Broachsharpening

External or internal broaches can be re-sharpened on the front face only with a cutting angle from 4 to 8°.

## PRE-DRILLING FOR TORX

| TORX [mm] | Bore-Ø [mm] | Tolerance 0.00 [mm] |
|-----------|-------------|---------------------|
| T5        | 1           | 0.05                |
| T6        | 1.4         | 0.05                |
| T7        | 1.55        | 0.07                |
| T8        | 1.9         | 0.1                 |
| T10       | 2.2         | 0.1                 |
| T15       | 2.6         | 0.1                 |
| T20       | 2.9         | 0.1                 |
| T25       | 3.5         | 0.1                 |
| T27       | 3.75        | 0.1                 |
| T30       | 4           | 0.1                 |
| T40       | 5           | 0.15                |
| T45       | 5.8         | 0.2                 |
| T50       | 6.7         | 0.2                 |
| T55       | 8.2         | 0.2                 |
| T60       | 9.2         | 0.2                 |

## ADJUSTMENT OF BROACHES FOR EXACT CENTERING

Broaching toolholders PCM 6180, 6190, 26200 and 26300 series are delivered adjusted within 0,015 for standard tools with exact length.  
When tools with different length are used, it is essential to re-adjust exact centering.

Experience has often proved turret bores are not in perfect alignment with the machine spindle after a certain working time. When misalignment is over 0.05, it is really necessary to re-adjust the turret positioning to avoid difficulties especially on small sizes.

When the machines are geometrically correct, PCM broaching toolholders pre-adjusted for standart tools length, can be mounted directly without setting. For broaches of different lengths, centering adjustment is necessary.

### Pre-setting for exact centering

The pre-setting holder (1) with bore H6, turn the toolholder (2) with spindle (3) together, provided with the gauge (4) in same length „L“ as the broach, to obtain a max. eccentricity of 0.02 on the right position of the gauge, checked with the clock (5).

4 radial screws assist this operation. Check again after clamping of the 4 front screws.

Comment: the slow revolution of the complete toolholder will show the small oscillation of the broach.

### Centering adjustment directly on the machine

Adjustment on the machine offers the advantage to correct the mis-alignment between machine spindle and turret bore. But the main inconvenience of this way is that the adjustment is only valid for one hole of the turret on the machine.

The diameter (1) is provided with the gauge (2) of equalent length « L » as the broach and stand. Fix the magnetic support with the clock on the chuck face.

Place the point at the right length on the gauge. Turn the machine spindle.

Adjust the concentricity to max. 0,02 using 4 radial screws, then clamp the 4 front screws. Check again after clamping.

If necessary, move the diameter in various positions and check again. The proper concentricity of the gauge and turning diameter should not exceed 0,012.
